Dimensions

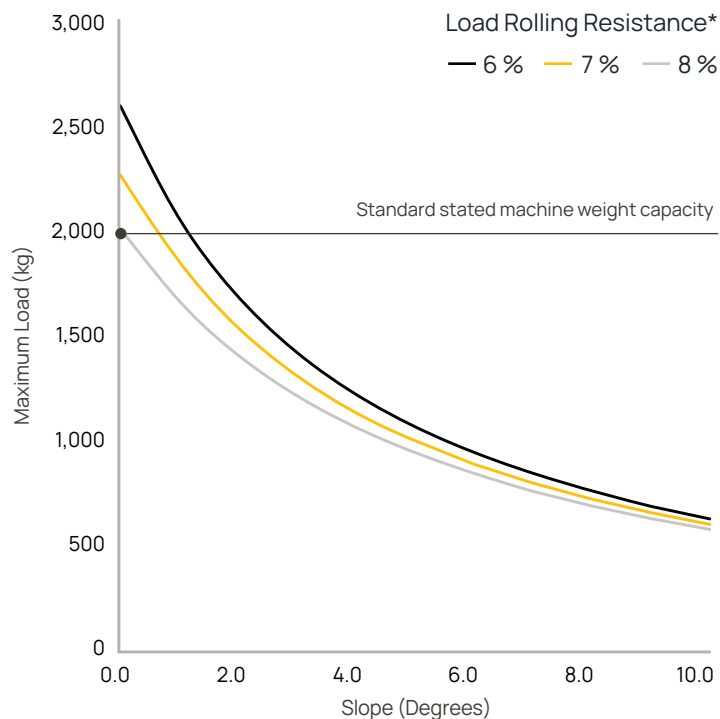

Slope Performance

The force required to move a load is based on load weight, slope angle and floor condition. Movement on a slope increases the force required to safely start, stop and move the load.

If your application involves moving a load up or down a slope, speak to our team who will be happy to advise on which machine will meet your requirements.

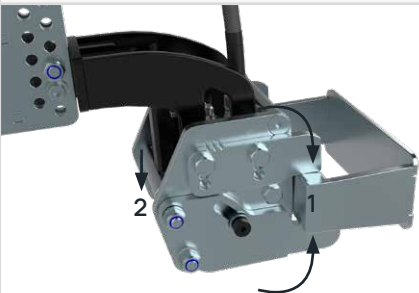

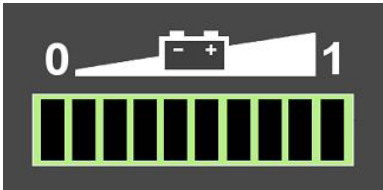

* Variables that affect rolling resistance include the quality of floor/terrain and the type/condition/quality of castor wheels.
